

Today I would like to explain the relationship between Air Bastion and Pure Air Industries as video is a much more digestible format, so without further ado.

At air bastion we have created a coin which stands as the **representation of the caring for air cleaning**. The goal of the coin is to clean the air from pollution starting in highly populated cities and then move into smaller cities, manufacturing plants and every place it is needed.

The coin is set to buy relevant data from air cleaning companies and in that way we are going to finance their efforts.

Coin purchasers are able to buy data from our platform much cheaper than if they pay with fiat or Ethereum or bitcoin. So the utility of it is clear.

Also, it works in flagging which governments and companies care for as we publish a list of companies and governments owning (we don't tell how many they have, but we rank them in order. In the same page we maintain a list of which companies and governments do NOT hold any of them.

The way we purchase this data is with an upfront contract. We pay for such amount of data for such a period of time upfront.

We do sell data to governments, corporates and research groups. We store transactions on a blockchain and our code of course is open sourced.

Governments caring about cleaning air pollution	Governments NOT caring about cleaning the air from pollution (or at least they don't care as of now)
